International Social Survey Program (ISSP)

INTERNATIONAL SOCIAL SURVEY PROGRAM: ROLE OF GOVERNMENT III,
1996 (ICPSR 2808)

SUMMARY: The International Social Survey Program (ISSP) is an ongoing program of cross-national collaboration. Formed in 1984, the group develops topical modules dealing with important areas of social science as supplements to regular national surveys. This survey is the third in a series exploring the "role of government" topic. The first survey on this topic was conducted in 1985-1986 (ICPSR 8909) and the second in 1990 (ICPSR 6010). Participating countries in the 1996 survey include Australia, Bulgaria, Canada, Cyprus, the Czech Republic, France, Germany, Great Britain, Hungary, Ireland, Israel, Italy, Japan, Latvia, New Zealand, Norway, the Philippines, Poland, Russia, Slovenia, Spain, Sweden, and the United States. Citizens' opinions were elicited on the function of their national governments and on what governments should and should not be doing. Respondents were asked whether they approved of economic policies such as wage and price controls; job creation programs, including public work projects; support for ailing private industries; and the forced reduction in the industrial work week, as well as conservative measures, such as reductions in government spending and business regulations. Government spending was another topic, with respondents questioned as to their support for greater spending on the environment, health care, police and law enforcement, education, military and defense, culture and the arts, old age pensions, unemployment benefits, and housing for the poor. A number of questions dealt with respondents' attitudes regarding democracy, political power, and protest. Respondents were asked for their views on the rule of law when it is in conflict with private conscience, various forms of anti-government protest (public meetings, protest marches and demonstrations, nationwide strikes), whether the right to protest should be afforded to those who advocate the overthrow of the government by revolution, and the conflict between security needs and privacy rights. Other questions focused on the role of elections in democracies, including whether voters understand political issues, whether elections force governments to confront pressing political issues, whether certain institutions (unions, government, business and industry) have too much power in affecting election results, whether politicians really try to keep their election promises, whether civil servants can be trusted to work in the public's interest, and whether various industries (power companies, hospitals, banks) are better off being run by the private sector or by the government. Opinions were also elicited as

to whether government had a legitimate role in the redistribution of wealth in the country, by tax policy or otherwise. Demographic variables include age, sex, education, marital status, personal and family income, employment status, household size and composition, occupation, religion and church attendance, social class, union membership, political party, voting history, and ethnicity.

UNIVERSE: Persons aged 18 years and older in the nations of Australia, Bulgaria, Canada, Cyprus, the Czech Republic, France, Germany, Great Britain, Hungary, Ireland, Israel, Italy, Japan, Latvia, New Zealand, Norway, the Philippines, Poland, Russia, Slovenia, Spain, Sweden, and the United States.

SAMPLING: Varies by nation.

NOTE: (1) The data file is in SPSS export format. (2) The codebook is provided as a Portable Document Format (PDF) file. The PDF file format was developed by Adobe Systems Incorporated and can be accessed using PDF reader software, such as the Adobe Acrobat Reader. Information on how to obtain a copy of the Acrobat Reader is provided through the ICPSR Website on the Internet. (3) The data dictionary, bivariate frequencies, and full question text portions of the PDF codebook are also provided in ASCII format. (4) This collection has not been processed by ICPSR staff. ICPSR is distributing the data and documentation for this collection in essentially the same form in which they were received. When appropriate, hardcopy documentation has been converted to machine-readable form and variables have been recoded to ensure respondents' anonymity.

RESTRICTIONS: The data were supplied by the Zentralarchiv fuer Empirische Sozialforschung in Cologne, Germany. To provide funding agencies with essential information about the use of archival resources, and to facilitate the exchange of information about research activities based on the Zentralarchiv's holdings, users are expected to send two copies of each completed manuscript to the Zentralarchiv. All manuscripts utilizing data made available through the Zentralarchiv should acknowledge that fact.

Acknowledgement of Assistance

All manuscripts utilizing data made available through the Zentralarchiv fuer empirische Sozialforschung should acknowledge that fact as well as identify the original collectors of the data. We kindly ask all users to follow some adaptation of the following statement:

The data utilized in this (publication) were documented and made available by the ZENTRALARCHIV FUER EMPIRISCHE SOZIALFORSCHUNG, KOELN. The data for the 'ISSP' were collected by independent institutions in each country (see: principal investigators in the study-description-schemes for each participating country). Neither the original collectors nor the ZENTRALARCHIV bear any responsibility for the analyses or interpretation presented here

In order to provide funding agencies with essential information about the use of archival resources, and to facilitate the exchange of information about research activities based on the ZENTRALARCHIV's holdings, each user is expected to send two copies of each completed manuscript to the ZENTRALARCHIV.

Please note

All marginals in this documentation are calculated from

unweighted data

Please consider also that - especially in the section of the background variables - the same code-values do not always have the same meaning for each country. The differences are documented in this codebook.

An Introduction to the ISSP

The International Social Survey Programme

The ISSP is a continuing annual programme of cross-national collaboration on surveys covering topics important for social science research. It brings together pre-existing social science projects and coordinates research goals, thereby adding a cross-national, cross-cultural perspective to the individual national studies. Twenty-nine countries are members of the ISSP.

It started late in 1983 when SCPR, London, secured funds from the Nuffield Foundation to hold meetings to further international collaboration between four existing surveys - the General Social Survey, conducted by NORC in the USA, the British Social Attitudes Survey, conducted by SCPR in Great Britain, the Allgemeine Bevölkerungsumfrage der Sozialwissenschaften, conducted by ZUMA in West Germany and the National Social Science Survey, conducted by ANU in Australia. Prior to this, NORC and ZUMA had been collaborating bilaterally since 1982 on a common set of questions.

The four founding members agreed to (1) jointly develop modules dealing with important areas of social science, (2) field the modules as a fifteen-minute supplement to the regular national surveys (or a special survey if necessary), (3) include an extensive common core of background variables and (4) make the data available to the social science community as soon as possible.

Each research organisation funds all of its own costs. There are no central funds. The merging of the data into a cross-national data set is performed by the Zentralarchiv für Empirische Sozialforschung, University of Cologne.

Since 1984, the ISSP has grown to 29 nations: the founding four - Australia, Germany, Great Britain and the United States - plus Austria, Bangladesh, Bulgaria, Canada, Chile, Cyprus, the Czech Republic, France, Hungary, Israel, Ireland, Italy, Japan, Latvia, the Netherlands, New Zealand, Norway, the Philippines, Poland, Portugal, Russia, the Slovakian Republic, Slovenia, Spain and Sweden.

The annual topics for the ISSP are developed over several years by a sub-committee and are pre-tested in various countries. The annual plenary meeting of the ISSP then adopts the final questionnaire. ISSP questions need to be relevant to all countries and expressed in an equivalent manner in all languages. The questionnaire is originally drafted in British English and then translated into other languages.

The ISSP marks several new departures in the area of cross-national research. First, the collaboration between organisations is not ad hoc or intermittent, but routine and continual. Second, while necessarily more circumscribed than collaboration dedicated solely to cross-national research on a single topic, the ISSP makes cross-national research a basic part of the national research agenda of each participating country. Third, by combining a cross-time with a cross-national perspective, two powerful research designs are being used to study societal processes.

Principal investigators: Carleton University Survey Centre

Sample type: Stratified Multi-stage Random Sampling

Fieldwork methods: Self-completion with drop-off and collection

Context of ISSP questionnaire:

Stand alone

Sampling method: A stratified multi-stage sampling method was employed using as the primary strata the five main regions; Atlantic Canada, Quebec, Ontario, Western Canada and British Columbia. Within these regions major sub-areas were randomly selected from Federal Electoral Districts.

Eastern Canada - St.Johns, Newfoundland, St.John, New Brunswick, Halifax, Nova Scotia, Charlottetown, Prince Edward Island

Quebec - Quebec East, Hull/Aylmer, Outremont/Westmount

Ontario - Ottawa East, Toronto Centre, Kingston and the Islands

Western Canada - St.Boniface, Manitoba, Regina East, Saskatchewan
Calgary West, Alberta

British Columbia - Fraser Valley East, North Vancouver/Burnaby
Vancouver Centre

Within each of these districts two Enumeration Areas were randomly selected. Using Census maps the first two streets that began with the letter **d** and **b** and contained more than 50 residential units were then chosen resulting in a total of 64 sampling frames. Interviewers were instructed to divide the number of residences on any given street by the number of sample points required. In-home sampling used the "first birthday" technique.

Fieldwork methods:

Context of ISSP questionnaire:

Sampling method: Two-stage cluster sampling

Step 1: Cyprus was divided into its four districts (Larnaca/Famagusta, Nicosia, Limassol, Paphos); sample size per district proportional to the percentage of the total country population residing in each district.

Step 2: Each district was divides according to the community type (urban, suburban and rural); sample size per community type proportional to the percentage of the total district population residing in each type.

After steps 1 and 2 we had 12 sampling regions (4 districts x 3 community types per district). At this point we performed two-stage cluster sampling in each sampling region as follows:

Stage 1: Divide each region into N clusters and randomly select n of these clusters.

Stage 2: In each cluster randomly select a starting point. begin the household selection process at this point, and follow a pre-assigned route selecting between 5 and 7 sampling units (households) in each cluster.

Study Description: Czech Republic

Study title: Role of Government, ISSP 1996

Fieldwork dates: First wave in the last decade of October 1996, second wave in the first half of December 1996

Principal investigators: Research team on Social Stratification, Institute of Sociology, Academy of Science of the Czech Republic, Prague

Sample type: Threee-stage random stratified sample

First stage: Selection of 100 largest settlements (cities and towns) in the Czech Republic. For every city/town on the list a random sampling of addresses was made to select a number of people corresponding the share of city/town population in the entire population of the Czech Republic.

Second stage: Random selection of addresses from other settlements up to the total size of the sample.

Third stage: a) Preparation of the list of all adult members (older than 18) in every contacted household.

b) Selection of the respondent using the "first birthday" technique.

If the selected person was not present, the interviewer had to make two other attempts to contact. The replacement by the person with the second closest birthday was allowed only in case of long term absence (one month or more) of firstly selected respondent.

Fieldwork institute: STEM - Center for Empirical Studies, Prague

Fieldwork methods: Standardized face-to-face interviews conducted by trained interviewers of STEM. 425 interviewers were contacted, 307 of them took part in the survey. Before the interviewers visit all respondents (or their households) were notified by a letter asking for cooperation.

Context of ISSP questionnaire:

Stand alone

Sample size: 1100

Response rates:

113	F - Refusals (refusing to take part)
125	G - Non-contact (never contacted)
1071	H - Other non-response

Response rate: $47.6\% = 2309 \text{ (total eligible)} / 1100 \text{ (total received)} \times 100\%$

Principal cause of the low response rate:

- 1.) Increasing unwillingness of potential respondents to be interviewed about political issues. Two elections held in 1996 - parliamentary elections (May 1996) and elections to the Senate (November 1996) enormously increased the number of surveys on political issues. It resulted in a certain hostility of people against polling agencies and surveys.
- 2.) Due to a number of reported misapplications of various databases of private address by advertisement companies there has been an increase of interview refusals in surveys using a fixed sampling frame.

Sampling frame:

VAKUS Database which includes every household paying for electricity, gas TV or radio (approx. 5.5 mil of households). The database is structured by regions (see the ISSP variable CZ_REG).

Weighting Procedure: Sample for Eastern Germany deliberately over-samples the five new federal states. If an analyses is made for all of Germany rather than eastern and western separately, weighting is necessary (described in Wasmer et al. 1996, p. 61f). ISSP 1996 is a person-based sample. Findings in the cumulative ALLBUS Codebook (ALLBUS 1980-96, Codebook ZA-No. 1795) suggest, however, that no weighting for analysis at household level is necessary (pp. 9-12). See 'statistics for weighting' in the National population statistics.

Information on the background variables:

MARITAL: The category 'single, never married' is asked 1996 only as 'single' (German word 'ledig'). The German word means 'unmarried'.

COHAB R: ALLBUS question is actually two questions. One includes partners who do not live with R. The second establishes who does live together with a partner.

EDUCYRS: constructed on bases of recode Education II. Scheme suggested by M: Braun.

WORKST R: ALLBUS formulations are 'fuul time', 'half time', 'on the side', 'not employed', 'helping family member', followed by those 'not in labour force'. 'On the side' means a little job, not an additional job.

WRKHRS R: not asked

WORKGOVT R: Germany cannot readily distinguish between government and public. ALLBUS asks if respondents work for the government (which in German covers public employment too) and whether they are self-employed. Categories two and three therefore not distinguished.

UNION R: additional questions in ALLBUS: (1) which TU; (2) Party member

INCOME F: Wording is: How high is the monthly net income of your household in toto? By that I mean the sum remaining after taxes and (various) contributions have been deducted.

R INCOME: Wording is: How high is your own monthly net income? By that I mean the sum remaining after taxes and (various)

contributions have been deducted. The contributions In German are something which sounds like 'social insurance' (Sozialversicherung). It includes (currently) old age pension contributions, unemployment contributions, a 'solidarity' contribution (for renewal in eastern Germany). Medical insurance, whether voluntary or compulsory is a separate contribution (lower salaries have compulsory medical insurance).

- HHCYCLE:** sex, date of birth, marital status for each person in household. In addition ALLBUS asks type of accommodation (rented, owned, etc.)
- PARTY_LR:** asked as scale. Also asked 'vote last election', 'Sunday vote', and 'why not vote'.
- REGION:** BIK type and political district size
- D_ETHN:** numerous question on nationality, country of origin, duration of residence in Germany, and information about parents are asked in ALLBUS.
- ISCO:** asked for those formerly employed as well and for spouse and for father.

Study Description: Great Britain

Study title: British Social Attitudes 1996

Fieldwork dates: May to July 1996

Principal investigators: Roger Jowell, Lindsay Brook, Alison Park, Katarina Thomson, Caroline Bryson.

Sample type: Stratified random probability. The sample is designed to be representative of adults aged 18 or over living in private accommodation in Great Britain. It was drawn from the Postcode Address File (PAF) which is a list of addresses compiled by the Post Office. The sample method involved a multi-stage design: first 200 postcode sectors were selected, with probability proportionate to the number of addresses in each sector. Thirty addresses were then selected in each sector by starting from a random point on the list of addresses for each sector and choosing each address at a fixed interval. Finally, when interviewers called at the addresses, they selected one dwelling unit and one respondent at the selected dwelling unit using a Kish grid.

Fieldwork methods: Self-completion supplement given to respondents following the face-to-face interview (on which the classification questions were asked). The supplement was either collected by the interviewer or posted back to the office.

Context of ISSP questionnaire:

SCPR's *British Social Attitudes* survey - Version A of the self-completion questionnaire (there were three different versions in total).

Sample size: Achieved on ISSP: 993

Weighted: Yes.

Weighting procedure: Data were weighted to take account of the fact that not all units covered in the survey had the same probability of selection. The weighting applied reflected the relative selection probabilities of the individual at the three main stages of selection: address; household; and individual. The average weight supplied was 1.3.

Study Description: Hungary

Study title: Role of Government

Fieldwork dates: October 1996

Principal investigators: TÁRKI, Budapest

Sample type: A three-stage proportional random sample was applied. The first stage of sampling was constituted by the selection of settlements, weighted by population size, taking four types of residence (Budapest, county seat, town, village) into consideration.

The second stage was the random selection of households based on the 1990 registration of Central Statistical Office.

For the third stage, interviewers selected the member of household to be a respondent using Kish-key. Only persons over 18 were selected, and the sample was expected to be representative for Hungarian adult population regarding sex, age and regional distribution.

Fieldwork methods: Face-to-face interviews

Context of ISSP questionnaire:

The ISSP Role of Government module was the second of three sections in the TÁRKI - OMNIBUSZ '96 questionnaire. The first one (questions 1-42) covered attitudes toward old age pension. The third section was about attitudes toward politics, and voting behaviour of respondent.

Sample size: 1500

Weighted: Yes

Weighting procedure: In 1996 Hungarian Statistical Office fielded a new microcensus (2 % of Hungarian population). Since demographic characteristics of Hungary have been changed since the last Census (which was the base of sampling

procedure) data show some sampling bias: middle-aged population is overrepresented in sample compared to the 1996 microcensus.

In order to correct the sampling error we computed a weighting variable taking into account the type of residence, sex, age and highest educational level. The weight of each cases was computed as $WEIGHT=(F/f)*(n/N)$, where N=7904813 (respondent above the age of 18 in the weighted 1996 microcensus data), n=1500, F= frequency of the population category in the census subsample the case belongs to, f= the parallel frequency in the 1996 Role of Government ISSP module of TÁRKI.

Study Description: Japan

Study title: Role of Government

Fieldwork dates: July 5 to 8, 1996

Principal investigators: Onodera, Noriko

Sample type: We used a two-stage stratified random sample of Japanese 16 or older. Properties of the sample: Representative of the Japanese Population 16 and older. First urban and rural areas are divided into a number of groups (strata) based on similarities in local features and industrial structures. From each of those groups, streets and village sections are again grouped together to form sampling units. 150 survey spots are selected at random. Then, from the Basic Resident Registers for these spots, 12 sample individuals aged 16 or over are selected according to a fixed random number.

Fieldwork dates: September 12 - 16, 1996

Principal investigators: Aivars Tabuns, Institute of Philosophy and Sociology, Riga
Brigita Zepa, Baltic Data House, Riga

Fieldwork institute: Latvia Social research Centre, OMNIBUS SURVEY Project manager:
Gundars Soprâns.

Sample type: Multi-stage stratified sampling of permanent residents of Latvia aged 15 - 74; nationally representative.
 First stage: selection of survey points by probability-proportional-to-size (PPS) sampling from the complete list of populated points and using the number of residents as a size measure. 10 interviews planned for each sample point.
 Second stage: selection of households by random route method. Each 4th apartment in areas of multistage buildings and odd/even sizes of streets in areas of family houses. Randomly selected starting addresses and rotation of sequence (ascending/descending count of apartment numbers).
 Third stage: selection of respondents by the "nearest birthday rule". In case of absence or no-home at least two call-backs.
 Sample points: 152.
 Controlling: 10 %.

Weighting procedure: Data have been weighted by multistage weighting procedure to reach the sample proportions according to the official statistics by gender, age, nationality and urban level. In each step data are weighted by one of the named variables which has the largest difference from statistic data. Steps are repeated while differences between the weighted sample and statistics on the named parameters do not exceed 0.1 %.

Study Description: New Zealand

Study title: Role of Government and Work Orientation: New Zealand

Fieldwork dates: 24 April 1997 to 5 August 1997

Principal investigator: Prof. Philip Gendall, Department of Marketing, Massey University, Palmerston North, New Zealand

Sample type: The sample was selected from the 1996 New Zealand electoral rolls which contain the names of all registered voters over the age of 18 years. New Zealand is divided into 65 electorates (60 general electorates and 5 Maori electorates) of approximately equal numerical size. A systematic random sample of approximately 30 names and addresses was selected from each electorate, giving a total sample of 1890 individuals.

The achieved sample is generally representative of the New Zealand population over 18 years of age, but it contains a slightly higher proportion of women than men in the population aged over 18. In addition, people under 30 are underrepresented in the sample, while those over 30 are overrepresented. However, these differences are unlikely to have a significant effect on the survey's results.

Fieldwork methods: Mail survey: The questionnaire was administered in three waves. The questionnaire together with a covering letter was sent to the 1890 selected participants on 24 April 1997. Three weeks later a reminder letter and another questionnaire were sent to non-respondents. A second reminder and another questionnaire were mailed to remaining non-respondents after further four weeks. The survey was closed off on 5 August, 14 weeks after the initial mailing.

Study Description: Philippines

Study title: Role of Government in the Philippines

Fieldwork dates: September 5 - October 5, 1996

Fieldwork institute: Social Weather Station

Sample type: Multi-stage probability sampling is used in selecting the adult respondents: for NCR (Manila region), three stages; for the rest of the major areas 5 stages.

For NCR's first stage, using the latest list of electoral precincts are allocated to 17 component cities/ municipalities in proportion to their population size. The precincts are selected randomly within each city/ municipality

At the second stage, 5 households are chosen from each sample precinct by an interval sampling method that is based on a precinct map and guided by a right-coverage rule - streets, pathways, households, etc. on the right take precedence. (The head of the selected household constitutes a sample unit of the population of household heads while all household members constitute the sample units of the general population.)

At the third stage, an adult (male interviewers are undertaken for odd-numbered questionnaires; female for even-numbered questionnaires) is taken in each household using separate random selection tables.

(Substitution is discussed in the next subsection.)

For the rest of the country, the provinces serve as the common first stage unit. Using updated population figures, 10 provinces in Balance Luzon and 5 each in Visayas and Mindanao are chosen with probability proportional to population size.

For the urban areas within each selected province, for the second stage, three cities/ municipalities are drawn within probability proportional to urban population size. For the third stage, 1 (for Balance Luzon to 2 (each for Visayas and Mindanao) precincts are selected with equal probabilities in each city/ municipality. For the fourth stage, in each precinct, the NCR interval sampling method is used to select 5 households. Finally for the fifth stage, as in NCR, an adult is chosen within each household using separate random selection tables.

For the rural areas within each selected province, the second stage takes the same municipality of the urban sample if it is not entirely urban.

Otherwise, another municipality with rural barangays (or barrios) is drawn with probability proportional to rural population size. For the third stage, 1 to 2 barangays/ barrios are selected in each sample municipality by simple random sampling. At the fourth stage, a modified interval sampling scheme is used to select 5 households considering their relatively sparse distribution in a barangay: the random start (between 1 to 5) is from fixed reference point (either a barangay hall, public school, church or barangay

captain's house). Finally, as with the urban sample, an adult is chosen within each household (5th stage) using separate random selection tables.

Weighting procedure: The national estimates are obtained by applying area weights which reflect the official population projections of the National Statistics Office (NSO) for April of 1995. As the official NSO projections do not have an urban-rural breakdown, SWS maintained the urban-rural levels reported in NSO's 1990 Census of Population and Housing. It should be noted that the 1995 projection figures for households are derived by SWS by dividing the NSO 1995 (household) population projections by the average household size in 1990.

Study Description: Russia

Study title: Role of Government - 1996 (Russia)

Fieldwork dates: April 8 - 30, 1997

Principal investigators: Dr. Ludmilla Khakhulina

Fieldwork institute: VCIOM, Moscow

Sample type: Universe - the population of the Russian Federation aged 16 and over.
The persons interviewed - residents of Russia, from the number of the available constantly residing population, i.e, the sample does not include people temporarily present in a given location (on business trip, leave, medical treatment; Soviet Army soldiers; convicts in prisons, penitentiary colonies) as well as those who have no a definite residence.
A multi-stage, stratified sample of interviewing locations was employed in the study.

Sampling: At the first stage, the territory of Russia is divided into 10 zones:
North+North-West, Central Non-Black Earth, Central Black Earth, North Caucasus, Volgo-Viatka, Volga, Urals, West Siberia, East Siberia and Far East. They are designed by official statistics according to the ethnic, economic, demographic, geographic characteristics, agriculture, level of infrastructure, and standard of living. All eleven zones will be included in the sample.

The total sample size is distributed over the 11 zones proportionate to the population size in it.

The nine strata of settlements are created considering the following characteristics of places of settlement: population size, administrative status, autonomy/non-autonomy; urban/rural settlements:

1. Metropolitan Moscow and St. Petersburg areas (as the self-representative statistical units).
2. The oblast center cities of one million residents or more
3. Oblast capitals of less than one million residents.
4. Small towns and rural settlements of city type
5. Rural settlements/villages.
6. Autonomous republic capitals of 300 000 residents or more.
7. Autonomous republican capitals of less than 300 000 residents.
8. Small towns and rural settlements of city type in autonomous republics.
9. Rural settlements/villages in autonomous republics.

The total number of questionnaires for a region is distributed over the strata proportionate to the population size of the stratum in the region's population. For each stratum we define the maximum and minimum limits in the number of respondents for a sampling point of each type. According

to the limits, we define the number of settlements of each type which is to be included in the sample. If the number of questionnaires for a stratum is lower than the minimum limit, the stratum is united with a larger one ("of a higher level"). The number of the questionnaire of the new created stratum is equal to the sum of the two primary ones.

We define the number of the sampling points for each existing stratum of a region ("existing" means that the number of the questionnaires for the stratum is not equal 0). The total number of questionnaire for a stratum is divided into the previously defined maximum number of the questionnaires for a sampling point. If the result has a fraction, we approximate it to the higher limit. The number of questionnaires for a stratum is equally distributed over all the stratum's sampling points.

We randomly choose the oblast, krais, and autonomous capital cities sampling points from the list of all the PSU in it with the probability proportionate to the population size.

At the second stage, within the chosen oblast's, krai's, and autonomous capital cities' areas, we randomly choose the other urban settlements with the probability proportionate to the population size.

In urban sampling points were randomly selected 2 or 3 electoral districts (no more than 10 interviews in each district) and the number of interviews relating to a city was equally divided between the electoral districts.

The field offices' supervisors choose rural places of settlement in the selected at the first stage oblasts, krais, and republics according to the following rules:

1. The number of sampling points is equally distributed over the chosen oblasts.
2. If there is more than one chosen rural settlement in the region, the number of the questionnaires is equally distributed over the rural settlements - the central estate of a farm and others rural settlements.
3. All the rural settlements are situated 50 and over km away from the chosen regional center city.

Third stage. Selection of the households within a sampling point.

The routine of the route method is as follows:

The territory of the city is divided into 2-3 areas (if the city's population is 500 000 and over - into 5-6 or more areas). Usually they are: the down town, industrial and living areas. The questionnaires which are to be completed in the city are distributed over the areas proportionally to the population size in them. (If the sample size is small, the questionnaires are distributed among 2-3 randomly chosen areas). We chose one district in an area.

The households within a district are chosen using the route method. (The same method is used for the rural settlements.) It is as follows:

The sample step (r) is calculated as $r = S : n$; S - number of households in the district, n - the number of questionnaires to be administrated in it. The

route begins from a household $N = r / 2$ and then goes on with the step (r). The possible deviation is +1/-1 a household.

Fourth stage. Selection of the respondent within a household.

An interviewer has a task which includes: the discretion of the route, the number of questionnaires to be completed, and sex-by-age and educational quota card. Only one respondent is interviewed within a household.

The fieldwork supervisors control the sample using the sex-by-age and educational quotas. (We have to use the quotas as lot of people with secondary education refuse to answer the questionnaire more often, and it increases the number of people with higher education in the sample).

The sampling is done with the help of the data of Goskomstat, 1997.

Fieldwork method:

drop-off, face-to-face interview

In the fieldwork, employees and part-time interviewers of 19 VCIOM regional offices were engaged. The completions are done by respondents at their home in the presence of the interviewer who was to prevent an influence of other household members on answers of the respondent. If a respondent was absent at the moment of an interviewer's call, callbacks to this address were envisaged, not exceeding three in number.

The work of every interviewer was controlled by telephone or a callback in the proportion of 1 per 10 interviews. 10 interviews have been excluded from the data massiv as a result of the control, and the total number of interviews has been shortened from 1,701 down to 1,691.

Context of ISSP questionnaire:

The questionnaire of the study included 112 questions (including the socio-demographic bloc).

ISSP-modul, consisting of 21 questions, were located between block of social-politics monitoring's questions (estimate of economical and political situation of the country; the level of ordinary life's problems; trust in political leaders, parties and social institutions; voting intentions; attention to some foreign-policy problems - totally 50 questions) and socio-demographic questions.

Language: Russian

Weighted: Yes

Weighting procedure: Reference on the distribution of respondents' totality and corrected sampling by controlled social groups
 The correction is realized separately for every generalized region (oblast`).
 The total expected number N of respondents for a certain region equals

$$N = N_0 * P,$$

where N_0 denotes the size of whole sample, P stands for share of the region in the entire population.

There are population groups involved in correction process:

- | | |
|-------------------|---|
| Gender groups: | 1. Male;
2. Female. |
| Age groups: | 3. 16 - 24 years;
4. 25 - 39 years;
5. 40 - 54 years;
6. 55 and over years. |
| Education groups: | 7. High school or incomplete one;
8. Common school (9-10 classes) or special engeneerings;
9. Incomplete common school. |

Weight coefficients are defined as extreme ones for the sum of squares of deviations of weighed estimates from corresponding precise values of proportions of the following social groups within the surveyed population

As a result of correction every respondent $X[k]$ becomes supplied with definite weight $W[k]$, being within the limits $0 < W[k] < \sim 10$, so that the following conditions were valid:

- 1) the value of $\sum(W[k])$ for region concerned were equal to N and
- 2) for every controlled group $G[i]$ the value $Q[i]$ being equal to

$$Q[i] = \sum(W[k] | X[k].belong to.G[i]) / N,$$

were closed to a share $P[i]$ of group $G[i]$ in region's population

$$\text{i.e. } Q[i] \sim P[i], i=1,2,\dots,16.$$

The value of J being equal to

$$J = \sum((Q[i]-P[i])^{**2}) + (\sum(W[k])/N - 1)^{**2},$$

serves the criterion for minimization on the weights` sets variety.

Group	1	2	3	4	5	6	7	8	9
In massif	4471	5529	1833	3140	2253	2774	1679	4897	3424

Statistic	4567	5432	1595	3130	2353	2921	1433	4714	3853

The deviation in structure of controlled social groups makes on the average less than 0.09 %.

Weight coefficients of respondents are distributed as follows:

Value	Quantity
0.000 - 0.100	0
0.101 - 0.200	0
0.201 - 0.500	237
0.501 - 1.000	746

2.001 - 5.000	65
5.001 -10.000	4
10.001 >	-

Sum of weight coefficients is 1691. All the coefficients are recorded in "weight" field.

Sum of weight coefficients makes 1691.0

Fieldwork dates: December 1995

Principal investigator: Prof. Dr. Niko Toš (Public Opinion and Mass Communication Research Centre, Ljubljana)

Sample type: Systematic multistage sample with random start of adults aged 18 years or older living at noninstitutional address in Slovenia is based on Central Register of Population. 140 PSU and 420 SSU are formed, with names and addresses of persons in final clusters. A replacement procedure is used for non-responses. Halves of sample with every second person selected were used for SJM95/3 (non ISSP) and SJM95/4 (ISSP) Survey. Study Description: Spain

Study title: Role of Government III

Fieldwork dates: 27 to 31 January 1996

Principal investigators: C.I.S. (Centro de Investigaciones Sociológicas)

Sample type: Representative sample of adults aged 18 years and over living in private households in Spain.

Field: The Canary and Balearic Islands are included; Ceuta and Melilla are excluded.

Affixation: Proportional.

Sampling geographical points: 162 municipalities and 47 provinces

Source: 1991 Census, Istituto Nazionale di Statistica (I.N.E.)

Sampling Procedure: "Polietápico", stratified by clusters; primary sampling units (municipalities) and secondary sampling units (electoral sections) selected in a simple random manner; and ultimate units (individuals) selected according to random routes, and quota by sex and age.

The strata have been made by crossing the 17 Autonomies with the size of habitat, divided into 7 categories: less than 2,000 inhabitants; between 2,001 and 10,000; between 10,001 and 50,000; between 50,001 and 100,000; between 100,001 and 400,000; between 400,001 and 1,000,000; more than 1,000,000 inhabitants.

Sampling error: For a confidence level of 95.5 % (2 sigmas) and P=Q, the error margin is +/- 2 for the overall sample.

Weighting procedure: A subsample was drawn among those who had still not responded after two subsequent reminders. About 50 % of them were selected for telephone interviewing, following the normal practices of Statistics Sweden. All respondents in the subsample has accordingly been given the weight 2.04. Please note that all frequencies given in this codebook are calculated from UNWEIGHTED data. However, in order to keep the representativeness of the sample, all calculations should be made using the weight (the name of the weight variable is weight).

Explanations

<1> A variable (and reference) number have been assigned to each item in the study. In the present codebook which documents the archived data set, these numbers are identical. Should the data set be subsetted or rearranged the variable numbers might change to reflect the order of the new data set while the reference numbers would remain unchanged to provide a link to the archived data set.

<2> Indicates the abbreviated (24 character maximum) variable label used within OSIRIS or SPSS system files.

<3> "Location" indicates the starting position of the variable when the dataset is stored in the OSIRIS format. "Width" describes the number of positions of the variable.

<4> "MD" indicates the designation of the missing data. MD1 indicates an explicit defined single value. MD2 designates a single value or a value range, i.e. all values equal or greater than this value have been declared missing. Although these categories are defined as missing data categories, this does not mean that the user should not or cannot use these codes if so desired.

<5> If a variable contains implied decimals, the message "Dec. places: xx" appears here, where xx is the number of decimal places.

<6> Indicates the full question text taken from the British questionnaire. Wherever possible the original sequence of questions has been retained, although some changes were necessary to integrate the different national questionnaires.

<7> Indicates commentaries and explanations added during the processing of the study. < within question or answer texts may indicate whether the questionnaire in a particular country is deviating from the general format.

<8> Indicates the code value for the single answer category.

<9> Indicates the textual definition of the codes. Abbreviations commonly used are DK (don't know), NA (no answer), Can't choose, Not applicable and Not available.

<10> Indicates percentaged frequencies by country. This form is used whenever code categories have the same meaning for all countries. Column percentages are based only on "valid cases". Missing data values were excluded from percentages.

Standard occupation classification unit groups within minor groups.

Source: In 1991 OPCS introduced a new occupation coding schema, the Standard Occupational Classification (SOC). "Occupations are viewed in SOC as coherent sets of work activities carried on by individuals. In defining occupational groups, the aim has been to distinguish as far as possible in terms of the type and level of skills required to carry out the main work activities" (OPCS, 1991b, p.2).

Note 0004

This Note refers to V297 and contains specific explanations about size and type of the place of residence.

United States

NORC size of place

Source: GSS Methodological Report No.4.

Within an SMSA and --

- 01 A large central city (over 250.000)
- 02 A medium size central city (50.000 to 250.000)
- 03 A suburb of a large central city (a)
- 04 A suburb of a medium size central city
- 05 An unincorporated area of a large central city
(division, township, etc.)
- 06 An unincorporated area of a medium central city

Not within an SMSA, (within a country) and --

- 07 A small city (10.000 to 49.999) (b)
- 08 A town or village (2.500 to 9.999)
- 09 An incorporated area less than 2.500 or an unincorporated area of 1.000 to 2.499 (c)
- 10 Open country within larger civil divisions, e.g.
township, division

Remarks:

- (a) A suburb is defined as any incorporated area or unincorporated area of 1.000+ (or listed as such in the U.S. Census PC (1)-A books) within the boundaries of an SMSA but not within the limits of a central city of the SMSA. Some SMSAs have more than one central city, e.g., Minneapolis-St. Paul. In these cases, both cities are coded as central cities.
- (b) If such an instance were to arise, a city of 50.000 or over which is not part of an SMSA would be coded '07'.
- (c) Unincorporated areas of over 2.499 are treated as incorporated areas of the same size. Unincorporated areas under 1.000 are not listed by the Census and are treated here as part of the next larger civil division, usually the township.
